Generative AI in healthcare: use cases, benefits, current trends and future outlook

Generative AI is reshaping healthcare, from automating medical scribing and responding to patient messages, to

streamlining operations and unlocking cost efficiencies - the list of potential AI use cases is endless.

During this exclusive luncheon we'll dive into real-world use cases and show how health leaders are using AI and machine learning to accelerate clinical trials, enhance data processing, and enable secure collaboration in scientific research. We'll explore how we addressed challenges around medical data standardization and access, and why a modern, cloud-native data platform is essential for scalable, secure, and compliant innovation.

TOGETHER WITH
