AI Agents That Run Production

Join NYC-based engineering executives for an evening of discussions centered on using AI to run production systems, optimize cost, reduce complexity, and accelerate engineering velocity. Learn from examples deployed across some of today's most successful companies like Coinbase, DoorDash, MSCI, and Zscaler.

While the cost of running, maintaining, and managing the production systems that power their applications balloons, ROI has not kept up. Observability tools proliferate, code multiplies, and the team size to manage it all expands—without resulting in productivity, velocity, or economic gains.

AI is changing that, and this discussion will explore how software, technology, and FinServ companies are deploying it across their production systems.

Topics include:

Real stories: How companies like Coinbase, DoorDash, and MSCI leverage AI across their production systems

Actionable advice: Where companies can deliver cost savings and performance improvements across infra and o11y

Cost optimization tactics: How companies are reducing their number of incidents and the time and team size it takes to resolve them
