Enhancing Your Edge

Edge computing is computing topology in which the content collection and delivery are placed closer to their endpoints. The goal of edge computing is to keep the traffic and processing local to eliminate delays. Currently, edge computing is being driven by IoT and requires processing to be close to the end rather than on a centralized cloud server. However, rather than creating brand new architecture, cloud computing and edge computing will evolve into centralized servers, on-premises servers and on the edge devices themselves.
