**When the Rubber Meets Network APIs. Why  
Connectivity is the New Horsepower for the  
Automotive Industry**

The automotive world is racing toward a smarter, more connected future, but one essential piece remains missing from the stack: network APIs. This panel dives into how programmable networks are becoming mission-critical for modern mobility.

Whether it's about keeping vehicles updated, navigating dense cities, or delivering seamless in-car experiences, network APIs are the engine behind it all.

Autonomous driving and teledriving – where ultra-reliable, low-latency connectivity is essential, especially in congested or complex environments

Over-the-air (OTA) updates – ensuring secure and complete software delivery, boosted by network quality of service controls

Reliable device and vehicle location – especially in urban canyons, indoors, and parking structures where GPS alone falls short

In-car entertainment – from video streaming to real-time contextual services, tied to connectivity status and driving conditions

Whether you're building the next-gen vehicle or the infrastructure that powers it, this conversation will help you understand why the road to automotive success is paved with network APIs.
